SYSTEM NAME	**EMERGENCY MANAGEMENT** PROCEDURE
SYSTEM NUMBER	RNSWP009
PURPOSE & SCOPE	The purpose of this procedure is to describe how the company manages and prepares for potential emergencies within their operations.
CONNECTING DOCUMENTS	RNSWF022 Emergency Drill Template RNSWPL001 Emergency Plan Template

TERM	DEFINITION
Risk	How severely can someone be harmed by a hazard and how likely it is that a person will be harmed by the hazard. The likelihood of damage to the environment
Incident	A work-related event(s) in which an injury or ill-health regardless of severity or fatality occurred, or could have occurred
Emergency	An unforeseen incident that requires immediate action to mitigate threats

TASK	STEPS	FREQUENCY	POSITION
Identifying likely emergencies for the company/	At the start of each year, a risk assessment is completed to identify potential emergencies. There are two types of emergency situations: • Enterprise-wide emergencies / accidents (such as fires, explosions, hurricanes, floods, etc.), and • Emergencies / accidents that may be associated with specific activities, equipment or work areas (such as accidental emissions to the atmosphere, accidental discharges to water and land, etc.) A list of potential emergencies must be developed and added to the **RNSWF001 Corporate Risk Register**.	Yearly	HSEQ Team
Identifying likely emergencies for each project	At the start of each project, a risk assessment is completed to identify potential emergencies. There are two types of emergency situations: • Enterprise-wide emergencies / accidents (such as fires, explosions, hurricanes, floods, etc.), and • Emergencies / accidents that may be associated with specific activities, equipment or work areas (such as accidental emissions to the atmosphere, accidental discharges to water and land, etc.) A list of potential emergencies for projects must be developed and added to the **Emergency Procedures Plan** in the Project Management plan/s.	Each Project	Project Manager

Preparing for emergencies	Once the potential emergencies are identified, an **Emergency Procedures Plan** must be developed to control these emergencies.	Yearly	HSEQ Team
The Emergency Procedures Plan	An Emergency Response Procedures Plan is developed for all buildings. The emergency plan sets out: • emergency contacts, including first-aid officers and local emergency facilities • site arrangements for how the alarm is raised • site-compound map showing escape routes and assembly point. Note: make sure the escape route avoids hazards like chemical or fuel store areas. • a locality map showing the site in relation to the local area. When completed, the plan is a resource for all personnel: all evacuation maps are printed and displayed around the buildings. The response plan is printed and located in every location.	Develop Yearly	HSEQ Team
Emergency preparedness training	Personnel who have the role of emergency controller must have appropriate training in preparing for and dealing with emergencies. Generally, warden training are considered adequate.	As Required	HSEQ Team
Emergency response training	Elements of basic emergency response are addressed at the general induction. These include location of the emergency assembly area, types of alarms in use, identity of first-aid officers, location of first-aid kits and spill-kits and fire-fighting equipment. Training in specific emergencies such as material spill response is identified in the risk assessment addressed as per training procedures.	As Required	HSEQ Team
Testing emergency procedures	The HSEQ Team must test emergency preparedness to ensure that response plans are effective: • A test evacuation is staged every six months • Use the **RNSWF022 Evacuation Drill Record** to record results of the test. • The test should use an observer: the local HSEQ Team is an appropriate choice of observer. Note that evacuation exercises without notice are not recommended. • Other tests may be conducted as appropriate, for example, testing response to a serious injury. If it is not possible or appropriate to test emergency procedures, training may be an acceptable alternative. The HSEQ Team must be able to demonstrate that the training was effective.	As Required/Six-Monthly	HSEQ Team

Emergency Response Equipment	Suitable emergency response equipment and materials are needed to perform a variety of functions during an emergency such as evacuation, leak detection, fire suppression, chemical / biological / radiological monitoring, communication, isolation, containment, shelter, personal protection, decontamination, and medical evaluation and treatment. The emergency response equipment are inspected and/or tested at regular intervals to ensure that it will be operational in an emergency situation.	As Required	HSEQ Team
